Galaxy Assembly as a function of Mass and Environment with VST (VST-GAME)

PI: A. Mercurio (INAF-Osservatorio Astronomico di Capodimonte, OANa)

The main aim of the survey is to disentangle and quantify the relative impacts of mass-quenching (e.g. AGN/SN feedback) and environmental-quenching (e.g. ram-pressure and/or tidal stripping, harassment, group-cluster collisions and "starvation").

One key missing ingredient is a panoramic and homogeneous dataset of high-quality optical imaging of galaxies in a wide and largely unexplored range of cluster environments, down to the dwarf regime (10^9 $M_\odot$), at a redshift when the galaxy population was still rapidly evolving.

Galaxy Assembly as a function of Mass and Environment with VST (VST-GAME)

PI: A. Mercurio (INAF-Osservatorio Astronomico di Capodimonte, OANa)

300h VST survey of perform a unique wide field coverage (20x20 Mpc^2 at z=0.4) of 12 massive galaxy clusters, at 0.2<z<0.6 (z median ~0.4), in four bands (u', g', r', i'), to explore galaxy evolution from the inner core to well beyond the virial radius (~5 Rvir), following the infall of galaxies along filaments, within groups, or directly from the field, up to 10^9 $M_\odot$, where model predictions are in tension with the data (e.g. too many dwarfs).

CLASH-VLT LP: completed on 3/2016 (207h)

Final redshift sample (nearly final):

~34500 redshifts (from ~50000 spectra incl. duplicates)
~7300 cluster members
~200 lensed galaxies to z~7 (>300 X-ray Chandra sources)
➡ 19 published papers to date

Redshift catalogs released to date:

- MACS1206
- MACS0416
- MACS2129
- A209
- RXJ2248 (AS1063) (HST area)

- z~4.0 [3.5-4.5] ~9000 gals per sq.deg (Bouwens et al. 2015, tab. A1)

M_{lim}=24.75 (5σ in 3”)

Outlook and legacy

VST/VISTA/HST+VIMOS/MUSE

✓ Goldmine for galaxy evolution studies in different environments:

- Large field of view (20x20 Mpc^2 at z=0.4) to explore a wide range of cluster environment and good data quality to reach the dwarf regime;
- Large spectroscopic members ample critical for the analysis of galaxy properties as a function of mass + environment + dynamical status of the cluster;
- Deep (IFU) spectroscopy to explore low-mass regimes + precise magnification maps for new exploration of (very) low mass/luminosity galaxies at z=3-7 beyond deepest HST fields.
- Large Field photometry: a window on high-redshift galaxies.

The first glimpse to the science era of E-ELT and JWST.

Thanks!!!
