## **1 INTRODUCTION AND SCOPE**

This document reports on the RCA26 Flight Model on - ground calibration. Tests were performed from 21 April 2006 to 03 May 2006 (including functional tests) at Alcatel Alenia Space - Milano according to the LFI Calibration Plan.

The following tests have been performed:

Date	Filename	Notes			
21-apr-06	030LFI26_RCA_FM_AMB_200604211855	RCA functional test at ambient temperature			
21-apr-06	044LFI26_RCA_FM_AMB_200604211908	RCA functional test at ambient temperature all channels on			
22-apr-06	044LFI26_RCA_FM_AMB_200604221109	RCA SPR check at room temp. on MAIN only, Pol. Plane less than -45deg			
22-apr-06	044LFI26_RCA_FM_AMB_200604221145	RCA SPR check at room temp. on SIDE only, Pol. Plane less than -45deg; file USELESS due to RACHEL problems			
22-apr-06	044LFI26_RCA_FM_AMB_200604221147	RCA SPR check at room temp. on SIDE only, Pol. Plane less than -45deg			
22-apr-06	044LFI26_RCA_FM_AMB_200604221217	RCA SPR check at room temp. on MAIN only, Pol. Plane -45deg; Channel A and B now show good response.			
22-apr-06	044LFI26_RCA_FM_AMB_200604221238	RCA SPR check at room temp. on SIDE only, Pol. Plane -45deg;			
27-apr-06	044LFI18_RCA_FM_CRY_200604270835	RCA functional test at cryogenic temperature			
27-apr-06	044LFI26_RCA_FM_CRY_200604270910	RCA functional test at cryogenic temperature			
27-apr-06	044LFI26_RCA_FM_XXX_200604270944	RCA 26 Phase Switch I-V curves 1st check			
27-apr-06	044LFI26_RCA_FM_TUN_200604271058	PS/SW tuning			
27-apr-06	044LFI26_RCA_FM_TUN_200604271206	VG1 tuning			
27-apr-06	044LFI26_RCA_FM_TUN_200604271508	VG2 tuning			
27-apr-06	044LFI26_RCA_FM_TUN_200604271822	DAE EBB Tuning			
27-apr-06	044LFI26_RCA_FM_ST3_200604271919	RCA ST3 test			
28-apr-06	044LFI26_RCA_FM_ST3_200604280358	u .			
28-apr-06	044LFI26_RCA_FM_THF_200604281128	Test interrupted due to erroneous closure of RACHEL programme. File corrupted			
28-apr-06	044LFI26_RCA_FM_THF_200604281235	File corrupted			
28-apr-06	044LFI26_RCA_FM_XXX_200604281538	File for testing RACHEL functionality			
28-apr-06	044LFI26_RCA_FM_THF_200604281611	RCA THF test. Interrupted to set the correct RACHEL parameters (offset, gain, labels, etc.)			
28-apr-06	044LFI26_RCA_FM_THF_200604281615	RCA THF test			
28-apr-06	044LFI26_RCA_FM_OFT_200604281722	RCA offset test; search for equal Vout on all Channels			
28-apr-06	044LFI26_RCA_FM_SPR_200604281838	RCA SPR test (input power = -32 dBm)			
28-apr-06	044LFI26_RCA_FM_XXX_200604281912	Long overnight acquisition in nominal working conditions. File corrupted (during the night a storm caused a power interruption)			
29-apr-06	044LFI26_RCA_FM_AMB_200604291042	Check on radiometer functionaity			
29-apr-06	044LFI26_RCA_FM_LIS_200604291450	RCA LIS test with steps on sky and reference load

## 4 TUNING

See [RD 2]

#### 4.1 BACK END MODULE OFFSET (OK --- PAOLA)

BEM offset is determined by recording each detector output when the FEM is off. The values stored are used in data analysis when required. The values are reported in *Table* 5-1.

Table 5 1. DEM offerst seals

Tuble 5-1. DEM offset values.							
		BEM	offset	(Volts)			
Detector	A			0.0048			
Detector	в			0.0045			
Detector	C			0.0048			
Detector	D			0.0056			

## 5 **BASIC PERFORMANCES**

#### 5.1 RCA\_OFT: RADIOMETER OFFSET

#### 5.1.1 Temperature offset

Temperature offset is measured as follows:

- DAE gain and offset are set to 1 and 0, respectively
- Sky Load control temperature is kept constant (the actual temperature changes due to the thermal interconnection between the Sky Load and the Reference Load)
- Reference temperature is changed until the Voltage output between sky and load signals is as close as possible.
- This process is repeated for all channels.

The output of the 044LFI26 RCA FM OFT 200604281722 dataset is reported in Figure 6-1.

500 1500 1000 Time (s) Figure 6-1: Voltage output. Upper panel: left, channel A, right, channel B. Lower panel: left, channel C, right, channel D. Changing signal is the reference output.

Data are selected in Rana\_view where the output is equal within the standard deviation. Temperature data are measured in the same time interval (see Figure 6-2).

0.165

500

1000

Time (s)

1500

Temperature sensors for Tsky and Tref are mounted on the copper flanges which provide the control stages for the two loads, respectively. SMON sensor is mounted on one of the ECCOSORB pyramids inside the Sky Load. RMON sensor is sticked on the Al case of the Reference Load.

The temperature offset is calculated, in antenna temperature, as Tsky-Tref and SMON-RMON. Sigma is calculated as  $\sigma = \sqrt{\sigma_{Tsky}^2 + \sigma_{Tref}^2}$ . Results are reported in Table 6-1.

0.160

**Table 6-1** Voltage offset values are reported in columns Tsky-Tref (Temperature measured at the interface with the control stage) and SMON-RMON (temperature measured at the tip of a pyramid inside the Sky Load and on the Reference Load Aluminium case, respectively).

Figure 6-2: Temperature sensor output: yellow: SMON (sky Load Eccosorb pyramid tip); light blue: Tsky (Sky load control temperature); violet: RMON (Reference Load case); red Tref (Reference Load control).

### 5.2 RCA\_LING: LINEARITY, ISOLATION, NOISE AND GAIN

This test includes both the RCA\_LIS and the RCA\_TNG. Files are named LIS. The linearity has been evaluated extensively by changing both the REF and the SKY temperature in several steps. From this data the noise temperature, isolation and gain can be also evaluated.

### 5.2.1 FEM performance summary

Here we report briefly the performances of the Front End Module 4F3 to be used as a reference for the the performances measured on the RCA26. Numbers are derived from [RD 4]. The noise temperatures

**Table 6-2:** Noise Temperatures, gains, and Bandwidth derived from FEM after gold re-plating. LNA are listed following JBO naming convention. For Thoise numbers in between parenthesis are corrected for isolation and measured using REF load steps. Noise temperature are calculated using **Physical Temperature**.

	T Noise FEM (K)	Gain dB	Bandwidth GHz
LNA 1 (OP1)	15.5 (14.7)	30.8	6.9
LNA 4 (OP2)	-	-	-
LNA 2 (OP3)	16.8 (15.1)	32.1	6.8
LNA 3 (OP4)	-	-	-

Specifically the analysis has been performed on the following datasets:

reference load temperature steps: 044LFI26\_RCA\_FM\_LIS\_200604300759 044LFI26\_RCA\_FM\_LIS\_200604301632

sky load temperature steps:

044LFI26\_RCA\_FM\_LIS\_200605010106 044LFI26\_RCA\_FM\_LIS\_200605020246 044LFI26\_RCA\_FM\_LIS\_200605010940 044LFI26\_RCA\_FM\_LIS\_200605011813

From these datasets the characteristic curves V output Vs. T input were built for each detector and then linear and parabolic fits have been performed, as reported in next sections.

#### 5.2.2 Reference temperature steps

The data were collected from the files 044LFI26\_RCA\_FM\_LIS\_200604300759 and 044LFI26\_RCA\_FM\_LIS\_200604301632 Hereafter the input data used for the analysis are reported:

**Table 6-3:** Input data used to derive the calibration curve of the RCA using temperature steps on REF. All the temperature are Physical (Kelvin). Voltages are in Volts.

The following fits have been performed (V is voltage in Volt and T is the input antenna temperature in Kelvin):

- linear fit: V=a0+a1\*T
- parabolic fit V(T):  $V=a0+a1*T+a2*T^2$
- inverse parabolic fit T(V): T=a0+a1\*V+a2\*V<sup>2</sup>

The fit results are reported here:

Table 6-4: Fitting parameters for REF steps.

Based on the fit results the noise temperatures have been estimated from the reference load temperature steps and are reported in table

*Table 6-5:* Noise Temperatures estimated from three different fitting function applied on data with REF steps.

	T noise (K) Linear Fit	T noise (K) Parabolic Fit V(T)	T noise (K) Inverse Parabolic Fit T(V)	T noise (K) Parabolic Fit (average)
Detector A	30.41	22.96	20.13	21.55
Detector B	35.44	23.99	17.16	20.58
Detector C	28.59	20.77	17.46	19.11
Detector D	32.06	21.36	15.10	18.23

#### 5.2.2.1 Photometric gain with REF variations

The overall photometric gain can be calculated as follows:

•	linear fit:	G0=a1 (K/V)
•	parabolic fit V(T):	G1=dT/dV (K/V)
•	inverse parabolic fit T(V):	G2=dV/dT (V/K)

In the case of non linear fit the photometric gain depends on the input temperature. The gain functions are reported hereafter:

#### Photometric Gain from Linear fit

Detector A:	G0	=	0.00334	(V/K)
Detector B:	G0	=	0.00348	(V/K)
Detector C:	G0	=	0.00453	(V/K)
Detector D:	G0	=	0.00426	(V/K)

#### Photometric Gain from Parabolic V(T) fit

Detector A:	Gl	=	0.0039	-2.81E-05	*	Т	(V/K)
Detector B:	G1	=	0.00433	-4.31E-05	*	Т	(V/K)
Detector C:	G1	=	0.00542	-4.47E-05	*	т	(V/K)
Detector D:	G1	=	0.00537	-5.58E-05	*	Т	(V/K)

#### 5.2.3 Sky Temperature Steps

The temperature sensor used for the analysis is the SMON\_TMP (ID = 09) which is the thermometer located on the Eccosorb SKY LOAD pyramids. Standard deviation of T and V has not taken into account on the fit.

Data set 044LFI26\_RCA\_FM\_LIS\_200605020246 from 24000 to 24600<sup>1</sup> Data set 044LFI26\_RCA\_FM\_LIS\_200605010106 from 4500 to 5100 and from 20800 to 21400 Data set 044LFI26\_RCA\_FM\_LIS\_200605010940 from 5900 to 6500 and from 21900 to 22500 Data set 044LFI26\_RCA\_FM\_LIS\_200605011813 from 7400 to 8000 and from 23900 to 24500

Using the RaNa routine receiver\_basic\_properties the temperature (physical) and the voltages have been carried out for each single data file. Then all the values have been combined to perform the fits (in IDL) outside the RaNa environment. The data are reported in the following tables

Table 6-6:         Input data as derived from	receiver_	basic_	properties	s RaNa
routine used to perform the fits. Only T	C change and	Vchange	data have be	en used.
Temperatures are in Kelvin, Voltages in	Volts.

As in the previous case (Reference steps) the following fits have been performed (V is voltage in Volt and T is the input antenna temperature in Kelvin):

- linear fit: V=a0+a1\*T
- parabolic fit V(T): V=a0+a1\*T+a2\*T<sup>2</sup>
- inverse parabolic fit T(V): T=a0+a1\*V+a2\*V^2

<sup>&</sup>lt;sup>1</sup> This point is not sequential w.r.t. to the others. It has been checked that this point does not affect the noise temperature calculation

The parameters of the linear and parabolic fits have been reported hereafter. Note that all the fits have been performed in antenna temperature and not in physical temperature.

 Table 6-7: Fitting parameters for SKY steps.

Detector D	31.08	19.01	10.84	14.92

**Table 6-8:** Noise Temperatures estimated from three different fitting function applied on data with REF steps.

An additional extrapolation has been performed in the following way: from the parabolic fit V = f(Tant) the voltage and gain at Tant = 0 have been calculated. Then the Noise temperature has been calculated as V(0)/G. Hereafter the results:

	Tnoise linearly extrapolated form Tant =0
Detector A	20.86
Detector B	21.94
Detector C	19.76
Detector D	20.98

### 5.2.3.1 Photometric Gain with SKY variations

The overall photometric gain can be calculated as follows:

- linear fit: G0=a1 (K/V)
- parabolic fit V(T): G1=dT/dV (K/V)
- inverse parabolic fit T(V): G2=dV/dT (V/K)

<b>_</b> //	FM 44 GHz RCA26 DATA ANALYSIS REPORT	Issue/Rev. No.:	PL-LFI-PS1-RP-018 1.0
		Date:	May 06
		Page :	12

In the case of non linear fit the photometric gain depends on the input temperature. The gain functions are reported hereafter:

#### Photometric gain from linear fit

Detector A:	G0 =	0.00342621	09 (V/K)			
Detector B:	G0 =	0.00354371	11 (V/K)			
Detector C:	G0 =	0.00459061	24 (V/K)			
Detector D:	G0 =	0.00427286	55 (V/K)			
<u>Photometric g</u>	ain fror	n parabolic V =	<u>f(T) fit</u>			
Detector A:	G1 =	0.004144214	-3.20E-05	*	Т	(V/K)
Detector B:	G1 =	0.004639317	-4.88E-05	*	т	(V/K)
Detector C:	G1 =	0.005745629	-5.14E-05	*	т	(V/K)
Detector D:	G1 =	0.005655957	-6.16E-05	*	Т	(V/K)

Here we compare the calibration curve V = f(T) obtained with parabolic fit on data with REF steps with the same curve with SKY steps.

*Figure 6-3:* Calibration functions as derived both from REF steps (continuous line) and from SKY steps (dashed line) using parabolic fit T = f(V)

## 5.2.4 Comparison between RCA data and data extrapolated from measurements on FEM 4F3

Figure 6-4: noise temperature based on physical temperatures (both FEM stand alone noise temperature used to calibrate the x –axis and values on x-axis itself); results from removing, or not, BEM offset, are presented. The effect of removing is that of lowering noise temperature by about 1K;

*Figure 6-5:* plot is evaluated converting all temperatures in antenna temperature before doing any extrapolation; as FEM noise temperature, the average noise temperature measured on OP1 and corrected for isolation (14.1K) was used (PL-LFI-

JBO-RP-099). Also RCA data have been corrected taking into account non perfect isolation (also if the correction is week). Two extrapolations have been considered for RCA data: the former (RCAfull) considering the full data set (from 13K to 33 K about) ; the latter (RCA1325), considering only the points in the range overlapping with JBO measurements (from 13K to 25K about). For JBO data, only the full data set is here considered (ranging from 0K to 25K about). BEM offset has not been removed

The comparison plots shown above (below) are drown following the same method described in chapter 11 of PL-LFI-PST-TN-073 . §11.1 and 11.2. Numbers found here are in agreement with those reported in the Technical Note.

The basic steps of the method can be summarized in the following terms.

During JBO test campaign on FEM 4F3 (January '06), the FEM was tested coupled with a BEM representative of the 44GHz flight model units: BEM\_44\_B3\_DC. It has not exactly the same architecture of the FM units but should have roughly comparable performance.

The full system has a non-linear response (that means the Voltage measured at the terminals of the BEM is not linearly proportional to the power entering the BEM), such as we say it works in a 'compressed' regime. A dedicated test was performed to estimate the degree of non-linearity and to correct noise temperatures evaluated just by using Y-factor method.

Test was operated using a variable attenuator interposed between the FEM and the BEM. At first, the total power exiting the FEM, for each position of the attenuator, was measured using a power meter, in order to characterise the net power entering the BEM; then, the voltage at the terminals of the BEM was recorded, for each level of attenuation.

In this way, a normalized diagram attenuation A (A=0dB corresponds to attenuation 0) vs  $V_{JBO}^*$  was traced, where  $V_{JBO}^* = Vout - Voff$  (being Voff the BEM offset measured when FEM currents are switched off). The best fit of this curve, as expected from a compressed regime, is a parabola.

The normalized input power, Pin, was then converted into thermodynamic temperature, basing on the noise temperature stand-alone measurements performed on the FEM, for that output OPi, as follows:

 $T(K)_{OPi} = (Tn+25K) \cdot [X - Tn / (Tn + 25K)], X = 10^{(A/10)}$ 

The method using the variable attenuator allows to reach power inputs corresponding to  $T_{LOAD} = 0K$  (when A=-4.25 dB is applied).

 $V_{JBO}^*$  measured at 25 K has been compared with  $V_{RCA}^*$  obtained, at the same temperature, from RCA tests (where  $V_{RCA}^*$  is the total voltage minus the BEM offset): in this way, the ratio  $S_{25K}$  was evaluated, converting  $V_{JBO}^*$  into  $V_{JBO-RCA}^*$ :

$$\mathbf{V}_{\mathrm{JBO-RCA}}^* = S_{25K} \cdot \mathbf{V}_{\mathrm{JBO}}^*$$

At the end, two curves have been traced, depending on the BEM offset, measured from RCA tests, has been re-added or not: interception of each curve with the T axis (when V=0) provides the sought noise temperature.

Main limits of this method are:

- the x axis (temperature) calibration of the T-V plot requires an indirect measurement (FEM stand alone noise temperature); FEM noise temperature is evaluated in the range 39.6 GHz-48.4 GHz.

→ the error committed is at the first order equal to the uncertainty on FEM stand alone noise temperature. Indirect measurements using a filter have shown that only a small amount (about 0.7 dB) of the power coming from outside the FEM's nominal bandwidth enters the BEM.

- loss into transmission waveguides (from FEM to BEM) is not considered.

 $\rightarrow$  losses of about 1-2 dB follow the signal amplification in the FEM: their impact can be considered negligible (and of the same order of RCA setup)

BEM used is only roughly representative of the FM units.

→ measurements reported in PL-LFI-PST-TN-073 suing two different representative BEM units BEM\_44\_B3\_DC and BEM\_44\_B4\_DC, provided comparable results.

#### 5.2.5 Consistency of the Results based on SKY steps

The white noise limit has been calculated and compared with the requirement. The white noise limit is defined at a given SKY temperature as follows:

Eq. 1: 
$$\Delta T = \sqrt{2} \cdot \frac{T_{SKY} + T_{SYS}}{\sqrt{B}} \cdot 1000 \left[ \text{mK} \cdot \sqrt{\text{sec}} \right]$$

where B is the bandwidth [Hz],  $\tau$  is the integration time [sec],  $T_{SKY}$  and  $T_{SYS}$  are the Skyload antenna temperature [K] and noise system temperature [K] respectively.

From measurements the white noise limit is calculated as follows:

Eq. 2: 
$$\Delta T = G[K/V] \cdot \frac{1}{\sqrt{2}} \cdot WN \cdot \sqrt{\frac{\tau}{\tau - \tau_{BT}}}$$

where WN is the white noise as derived from RaNA,  $\tau$  is the 122 microSec (1/8KHz) integration time and  $\tau_{RT}$  is the blanking time (7.5 microSec). G is the gain (K/V) which needs to be know from RCA\_TNG tests.

The requirements has been calculated assuming Tsys = 16.6 Kelvin and B = 8.8 GHz (see [AD 2]), while the white noise limit form measurements has been derived in three ways:

- 1. From the Tsys and B derived from tests applying the Eq. 1. Tsys values were obtained from parabolic fit V(T) and B were obtained from RCA\_SPR test
- 2. Directly From WN measurements applying the Eq. 2 where *WN* is the white noise level derived from RaNA FFT module when the detector output is calibrated. Firstly the white noise limit has been derived form *RaNA\_FFT* module selecting a stable (~600 sec) calibrated acquisition data chunk. The White noise of differenced calibrated<sup>2</sup> detectors has been selected (A–B and C–D). Then the number has been corrected by the Blanking time.
- 3. White noise derived from B obtained from WN level (from RaNA FFT) and Tsys from LIS results.

<sup>&</sup>lt;sup>2</sup> The calibration has been obtained in the following way:

Note that the consistency check has been repeated also using data with SKY = 20K and REF = 20K. Moreover the consistency check has been performed also using the noise temperatures derived from linear extrapolation at Tin = 0.

Table 6-9: white noise as derived from measure	ements (Tsys, B from SPR, calibrated

The temperature step sequence is reported in Table 7-1.

Table 7-1: Reference Temperature steps for Noise properties test (STn)

SKY Temperature	REF Temperature	Duration
13.0 K	8.0 K	$\leq$ 2 hours
13.5 K	15.0 K	$\leq$ 2 hours
14.1 K	20.0 K	≤ 2 hours
20.0 K	20.0 K	≤ 2 hours

RaNA reports (044LFI26 RCA FM ST3 200604271919 and 044LFI26 RCA FM ST3 200604280358) have been uploaded on max.iasfbo.inaf.it (directory RCA026 Docs).

#### 6.1.1 **One–Over–F** Noise

A fourier transform has been applied on data to obtain the 1/f knee frequency and noise properties. The following data set have been used:

13.0 / 8.0 Selected from 3400 - 7000 sec, bin 10 for FFT and 1/f from file 044LFI26 RCA FM ST3 200604271919 13.5 / 15.0 Selected from 10400 - 14000 sec, bin 10 for FFT and 1/f from file 044LFI26\_RCA\_FM\_ST3\_200604271919 14.1 / 20.0 Selected from 18000 - 21600 sec, bin 10 for FFT and 1/f from file 044LFI26\_RCA\_FM\_ST3\_200604271919 20.0 / 20.0 Selected from 3100 - 6700 sec, bin 10 for FFT and 1/f from file 044LFI26 RCA FM ST3 200604280358

In the following table the 1/f characteristics obtained by an optimized fitting is reported. The numbers of point used for the low frequency fit is reported for each detector. BIN = 10 is used (fsampl =409.600).

#### 6.2 RCA\_UNC: UNCHOPPED DATA

Noise properties have been derived also from unchopped data, i.e. with all the phase switches off. The knee frequencies reported in the tables below are in Hz. The following data set have been analysed:

- 044LFI26\_RCA\_FM\_UNC\_200605021247
- 044LFI26\_RCA\_FM\_UNC\_200605021346
- 044LFI26\_RCA\_FM\_UNC\_200605021453
- 044LFI26\_RCA\_FM\_UNC\_200605021546

The corresponding RaNA report sare available on max server (max.iasfbo.inaf.it).

#### 6.2.1 PS/SW ln1 diode reverse, ln2 diode forward on all channels

## 7 SUSCEPTIBILIY TESTS

Any thermal and electrical variation on the RCA subsystem units produces a variation of the output signal from each of the four detector.

The relationship between the thermal (or electrical variation) and the variation of the output signal is:

$$(\bullet T_{meas}^{param}) = f_{param} \mathbf{x} (\bullet P)$$

where the  $f_{\text{param}}$  represents a transfer function that can also be derived from analytical models of the LFI receivers and  $\bullet P$  the variation of the parameter.

#### 7.1 RCA\_THV: SUSCEPTIBILITY TO V-GROOVE TEMPERATURE VARIATIONS

#### 7.2 RCA\_THB: SUSCEPTIBILITY TO BEM TEMPERATURE VARIATIONS

#### 7.3 RCA\_THF: SUSCEPTIBILITY TO FEM TEMPERATURE VARIATIONS

The test has been performed by varying the temperature of the FEM keeping constant the temperatures of the other thermal interfaces.

The temperature of the FEM has been set to 20K (nominal), 22K, 24K, and 27K as seen in Figure -8

Figure -8: FEM temperature step during the RCA\_THF test

The temperature behaviour of the other thermal interfaces are reported in the next figures (Figure -9 and Figure -10) showing the sky load (SKY\_TEMP and SMON\_TMP) and reference load temperatures, and the BEM temperature.

*Figure -9*: Left – Reference Load temperature behaviour during the RCA\_THF test; right – SKY\_TEMP probe (red) and SMON\_TMP probe (green)

Figure -10: BEM temperature behaviour during the RCA\_THF test

To do the analysis, the radiometric output for each channel in the three steps was recorded. We can see the output of the channels in the figures below:

Figure -11: Radiometric output of the 4 detectors during the RCA\_THF test. Sky

(red) and Ref (green)

## 7.3.1 Analysis using the SKY\_TEMP probe as sky load temperature:

The default parameters for the four channels are:

	Ch. A	Ch. B	Ch. C	Ch. D
Freq.(GHz)		2	14	
$L_{feed-OMT}$ (dB)		0	.1	
$L_{4k}$ ( <i>dB</i> )		0	.1	
r	1.0830277	1.0594471	1.1322518	1.1176707
T <sub>sky</sub> (K)		12.	9055	
T <sub>ref</sub> (K)		7.9	9999	
G <sup>dB</sup> <sub>F1</sub> ( <i>dB</i> )		-	35	
$G_{F2}^{dB}$ (dB)		2	35	
$T_{nF1}$ (K)	20	20	20	20
$T_{nF2}$ (K)	20 20 20 20			
$\partial G_{F1}^{dB} / \partial T_{phys}^{FE}$ (dB/K)	-0.05	-0.05	-0.05	-0.05

FM 44 GHz RCA26 DATA ANALYSIS REPORT	Issue/Rev. No.:	PL-LFI-PSI-RP-018 1.0
	Date:	May 06
	Page :	31

To improve the results obtained with the default parameters, I am going to change any of them. In particular, I change the  $\partial G_{FE}^{dB}/\partial T_{phys}^{FE}$  and  $\partial T_{nFE}/\partial T_{phys}^{FE}$ . The best values will be:

	Ch. A	Ch. B	Ch. C	Ch. D
$\partial G_{F1}^{dB} / \partial T_{phys}^{FE}$ (dB/K)	-0.098	-0.079	-0.121	-0.13
$\partial G_{F2}^{dB} / \partial T_{phys}^{FE}$ (dB/K)	-0.098	-0.079	-0.121	-0.13
$\partial T_{nF1} / \partial T_{phys}^{FE}$ (K/K)	0.1	0.1	0.246	0.145
$\partial T_{nF2} / \partial T_{phys}^{FE}$ (K/K)	0.1	0.1	0.246	0.145

#### Table -4: Optimized parameters of RCA\_THF test

and calculating the transfer functions, the new results:

To improve the results obtained with the default parameters, I am going to change any of them. In particular, I change the  $\partial G_{FE}^{dB}/\partial T_{phys}^{FE}$  and  $\partial T_{nFE}/\partial T_{phys}^{FE}$ . The best values will be:

Table -8: Optimized parameters of RCA\_THF test

	Ch. A	Ch. B	Ch. C	Ch. D
$\partial G_{F1}^{dB} / \partial T_{phys}^{FE}$ (dB/K)	-0.085	-0.073	-0.09	-0.11
$\partial G_{F2}^{dB} / \partial T_{phys}^{FE}$ (dB/K)	-0.085	-0.073	-0.09	-0.11
$\partial T_{nF1} / \partial T_{phys}^{FE}$ (K/K)	0.095	0.067	0.25	0.126
$\partial T_{nF2} / \partial T_{phys}^{FE}$ (K/K)	0.095	0.067	0.25	0.126

and calculating the transfer functions, the new results:

*Figure -15: RCA\_THF theoretical Vs measured transfer function after optimization of the parameters.* 

 Table -9: RCA\_THF Optimal transfer function Vs. theoretical

#### 7.4 RCA\_ELE: SUSCEPTIBILITY TO DISTURBANCE ON BIAS LINES

The file considered is 044LF126\_RCA\_FM\_ELE\_200605021037 Module used: Rana\_FFT, fast and normal FFT, no windowing Binning: 5 (v<100 Hz), 1 above

Disturbance applied on Vg1 channel S1 Temperatures: Sky: 13 K, Ref: 8.5 K I\_drain: stable on alla channels

By observing the FFT on selected data, a signal is present on SKY and LOAD data at the perturbing frequency. Amplitude is of the order of 10E-4 V/Sqr(Hz). Perturbing signal is not present in S-L data. 50 Hz signal is observed in SKY, LOAD and unscrambled data. It is not observed, as expected, in S-L data. Spikes are present on LOAD data only around 30Hz. These effect, as for the other RCAs, is due to the data acquisition of housekeeping data. This effect is not observed when 2kHz disturbance is applied on C and D channels.

Spikes (amplitude of the order of 10e-4 V/Sqr(Hz)) are also observed at high frequency in unscrambled data for  $v_{dist}$ < 4kHz. Peaks are centered at a frequency of 4096- $v_{dist}$ . When  $v_{dist}$  is above 4kHz, no 'direct' disturbance is observed in SKY and LOAD data. Still, peaks at frequency 4096- $v_{dist}$ . are observed. These spikes do not disappear in SKY – LOAD data. This effect is still to be studied in detail.

## 8 **CONCLUSIONS and CALIBRATION MATRIX**

## 9 GAIN MODEL

A new gain model has been developed based on paper of "William C. Daywitt, *Radiometer Equation and Analysis of Systematic Errors for the NIST Automated Radiometers*, 1989" modified for the case of LFI.

The gain model is the following:

Basically the hypothesis are the following: The FEM has constant gain and Thoise.

$$FEM: \begin{cases} Gain = G^{(FEM)} \\ Noise = T_N^{(FEM)} \end{cases}$$

The BEM has a gain which depends on the BEM input power as follows

$$BEM:\begin{cases} Gain = G^{BEM} = \frac{G_0^{BEM}}{1 + b \cdot G_0^{BEM} \cdot p} \\ Noise = T_N^{BEM} \end{cases}$$

Where p is the power entering the BEM and a is a parameter defining the non linearity of the BEM. Of course this is a particular gain model but some consideration can be appointed:

- 1) For b = 0 the radiometer is linear.
- 2) For b = infinity the BEM has a G=0
- 3) For p = infinity the BEM is completely compressed and G = 0 has expected

Now the power entering the BEM (we neglect the attenuation of the WGs which may be included in the FEM parameters) is:

$$p = k \cdot B \cdot G_0^{FEM} \cdot (T_A + T_N^*), \text{ Where } T_N^* = T_N^{BEM} + \frac{T_N^*}{G_0^{FEM}}$$

So at the output of the BEM we have (the diode constant is considered inside the BEM gain)

$$\begin{split} V_{out} &= k \cdot B \cdot G_0^{FEM} \cdot \frac{G_0^{BEM} \cdot \left(T_A + T_N^*\right)}{1 + b \cdot k \cdot B \cdot G_0^{BEM} \cdot \left(T_A + T_N^*\right)} = G_0 \cdot \left[\frac{1}{1 + b \cdot G_0 \cdot \left(T_A + T_N^*\right)}\right] \cdot \left(T_A + T_N^*\right) \\ G_0 &= G_0^{FEM} \cdot G_0^{BEM} \cdot k \cdot B \end{split}$$

Or in a compact way

$$\begin{aligned} V_{out} &= G_{tot} \cdot \left(T_A + T_N^*\right) \\ G_{tot} &= G_0 \cdot \left[\frac{1}{1 + b \cdot G_0 \cdot \left(T_A + T_N^*\right)}\right] \end{aligned}$$

INAF/IASF – BOLOGNA LFI Project System Team

Gtot is the radiometer gain which depends on the input antenna temperature.

A fit on the data has been performed with this following function:

$$V_{out} = G_0 \cdot \left\lfloor \frac{1}{1 + b \cdot G_0 \cdot \left(T_A + T_N^*\right)} \right\rfloor \cdot \left(T_A + T_N^*\right)$$

And  $G_0$ ,  $T_N^*$  and b have been derived form data taken on sky temperature steps. Here the results:

	$G_0$	$T_N^*$	b
Detector A	0.00523	18.1	1.11376
Detector B	0.00674	17.2	1.42726
Detector C	0.00755	16.6	0.9632
Detector D	0.00828	16.3	1.2297

The gain functions have been derived and the white noise levels have been calculated:

$$\begin{split} G_{tot}^{A} &= \cdot \left[ \frac{0.00532}{1 + 0.0058249648 \cdot (T_{A} + 18.1)} \right] \\ G_{tot}^{B} &= \cdot \left[ \frac{0.00674}{1 + 0.0096197324 \cdot (T_{A} + 17.2)} \right] \\ G_{tot}^{C} &= \cdot \left[ \frac{0.00755}{1 + 0.0072721600 \cdot (T_{A} + 16.6)} \right] \\ G_{tot}^{D} &= \cdot \left[ \frac{0.00828}{1 + 0.0101819160 \cdot (T_{A} + 16.3)} \right] \end{split}$$
